Background: The protein encoded by this gene is a member of the Ser/Thr protein kinase family. This protein is a catalytic subunit of the highly conserved protein kinase complex known as M-phase promoting factor (MPF), which is essential for G1/S and G2/M phase transitions of eukaryotic cell cycle. Mitotic cyclins stably associate with this protein and function as regulatory subunits. The kinase activity of this protein is controlled by cyclin accumulation and destruction through the cell cycle. The phosphorylation and dephosphorylation of this protein also play important regulatory roles in cell cycle control. Alternatively spliced transcript variants encoding different isoforms have been found for this gene.

Immunohistochemistry analysis of paraffin embedded Human thyroid cancer tissue using 213420(CDK1 Antibody) at a dilution of 1/20(Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human thyroid cancer tissue is first treated with the synthetic peptide and then with 213420(Anti-CDK1 Antibody) at dilution 1/20.

The image on the left is immunohistochemistry of paraffin-embedded Human brain tissue using 213420(Anti-CDK1 Antibody) at a dilution of 1/20.

In comparison with the IHC on the left, the same paraffin-embedded Human brain tissue is first treated with synthetic peptide and then with D160158(Anti-CDK1 Antibody) at dilution 1/20.
