Background: The protein encoded by this gene is a cytokine that controls the production, differentiation, and function of granulocytes and macrophages. The active form of the protein is found extracellularly as a homodimer. This gene has been localized to a cluster of related genes at chromosome region 5q31, which is known to be associated with interstitial deletions in the 5q- syndrome and acute myelogenous leukemia. Other genes in the cluster include those encoding interleukins 4, 5, and 13.

Immunohistochemistry analysis of paraffin embedded Human colorectal cancer tissue using 216536 (CSF2 Antibody) at a dilution of 1/150 (Secreted).

In comparison with the IHC on the left, the same paraffin-embedded Human colorectal cancer tissue is first treated with the fusion protein and then with 216536 (Anti-CSF2 Antibody) at dilution 1/150.

The image on the left is immunohistochemistry of paraffin-embedded Human liver cancer tissue using 216536 (Anti-CSF2 Antibody) at a dilution of 1/150.

In comparison with the IHC on the left, the same paraffin-embedded Human liver cancer tissue is first treated with fusion protein and then with D220700 (Anti-CSF2 Antibody) at dilution 1/150.
