Background: The enzyme encoded by this gene is a type I gamma-glutamyltransferase that catalyzes the transfer of the glutamyl moiety of glutathione to a variety of amino acids and dipeptide acceptors. The enzyme is composed of a heavy chain and a light chain, which are derived from a single precursor protein. It is expressed in tissues involved in absorption and secretion and may contribute to the etiology of diabetes and other metabolic disorders. Multiple alternatively spliced variants have been identified. There are a number of related genes present on chromosomes 20 and 22, and putative pseudogenes for this gene on chromosomes 2, 13, and 22.

Immunohistochemistry analysis of paraffin embedded Human tonsil tissue using 211230(GGT1 Antibody) at a dilution of 1/40(Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human tonsil tissue is first treated with the fusion protein and then with 211230(Anti-GGT1 Antibody) at dilution 1/40.

The image on the left is immunohistochemistry of paraffin-embedded Human thyroid cancer tissue using 211230(Anti-GGT1 Antibody) at a dilution of 1/40.

In comparison with the IHC on the left, the same paraffin-embedded Human thyroid cancer tissue is first treated with fusion protein and then with D122415(Anti-GGT1 Antibody) at dilution 1/40.
