Background: The protein encoded by this gene is one of the subunits of a heterodimeric cytokine complex. This protein is related to interleukin 12A (IL12A). It interacts with Epstein-Barr virus induced gene 3 (EBI3), a protein similar to interleukin 12B (IL12B), and forms a complex that has been shown to drive rapid expansion of naive but not memory CD4(+) T cells. The complex is also found to synergize strongly with interleukin 12 to trigger interferon gamma (IFNG) production of naive CD4(+) T cells. The biological effects of this cytokine are mediated by the class I cytokine receptor (WSX1/TCRR)

Immunohistochemistry analysis of paraffin embedded Human liver cancer tissue using 216580(IL27 Antibody) at a dilution of 1/15(Cytoplasm).

In comparison with the IHC on the left, the same paraffin-embedded Human liver cancer tissue is first treated with the fusion protein and then with 216580(Anti-IL27 Antibody) at dilution 1/15.

The image on the left is immunohistochemistry of paraffin-embedded Human cervical cancer tissue using 216580(Anti-IL27 Antibody) at a dilution of 1/15.

In comparison with the IHC on the left, the same paraffin-embedded Human cervical cancer tissue is first treated with fusion protein and then with D220843(Anti-IL27 Antibody) at dilution 1/15.
